#### **Disclaimer**

This specification and the material contained in it, as released by AUTOSAR, is for the purpose of information only. AUTOSAR and the companies that have contributed to it shall not be liable for any use of the specification.

The material contained in this specification is protected by copyright and other types of Intellectual Property Rights. The commercial exploitation of the material contained in this specification requires a license to such Intellectual Property Rights.

This specification may be utilized or reproduced without any modification, in any form or by any means, for informational purposes only.

For any other purpose, no part of the specification may be utilized or reproduced, in any form or by any means, without permission in writing from the publisher.

The AUTOSAR specifications have been developed for automotive applications only. They have neither been developed, nor tested for non-automotive applications.

The word AUTOSAR and the AUTOSAR logo are registered trademarks.

#### Advice for users

AUTOSAR specifications may contain exemplary items (exemplary reference models, "use cases", and/or references to exemplary technical solutions, devices, processes or software).

Any such exemplary items are contained in the specifications for illustration purposes only, and they themselves are not part of the AUTOSAR Standard. Neither their presence in such specifications, nor any later documentation of AUTOSAR conformance of products actually implementing such exemplary items, imply that intellectual property rights covering such exemplary items are licensed under the same rules as applicable to the AUTOSAR Standard.

## 1 Introduction and functional overview

This document specifies macros for the abstraction of compiler specific keywords used for addressing data and code within declarations and definitions.

Mainly compilers for 16-bit platforms (e.g. Cosmic and Metrowerks for S12X or Tasking for ST10) are using special keywords to cope with properties of the microcontroller architecture caused by the limited 16 bit addressing range. Features like paging and extended addressing (to reach memory beyond the 64k border) are not chosen automatically by the compiler, if the memory model is not adjusted to 'large' or 'huge'. The location of data and code has to be selected explicitly by special keywords. Those keywords, if directly used within the source code, would make it necessary to port the software to each new microcontroller family and would prohibit the requirement of platform independency of source code.

If the memory model is switched to 'large' or 'huge' by default (to circumvent these problems) the project will suffer from an increased code size.

This document specifies a three-step concept:

- 1. The file Compiler.h provides macros for the encapsulation of definitions and declarations.
- 2. Each single module has to distinguish between at least the following different memory classes and pointer classes. Each of these classes is represented by a define (e.g. EEP\_CODE).
- 3. The file Compiler\_Cfg.h allows to configure these defines with the appropriate compiler specific keywords according to the modules description and memory set-up of the build scenario.

# 2 Acronyms and abbreviations

Acronyms and abbreviations that have a local scope are not contained in the AUTOSAR glossary. These must appear in a local glossary.

Acronym:	Description:	
Large, huge	Memory model configuration of the microcontroller's compiler. By default, all access mechanisms are using extended/paged addressing.	
	Some compilers are using the term 'huge' instead of 'far'.	
Tiny, small	Memory model configuration of the microcontroller's compiler. By default, all acces mechanisms are using normal addressing.	
	Only data and code within the addressing range of the platform's architecture is reachable (e.g. 64k on a 16 bit architecture).	
far	Compiler keyword for extended/paged addressing scheme (for data and code that may be outside the normal addressing scheme of the platform's architecture).	
near	Compiler keyword for normal addressing scheme (for data and code that is within the addressing range of the platform's architecture).	
C89	ANSI X3.159-1989 Programming Language C	
C90	ISO/IEC 9899:1990	
C99	ISO/IEC 9899:1999, 2nd edition, 1. December 1999	
EmbeddedC	ISO/IEC DTR 18037, draft standard, 24. September 2003

# 4 Constraints and assumptions

### 4.1 Limitations

During specification of abstraction and validation of concept, the compilers listed in chapter 3.1 have been considered. If any other compiler requires keywords that cannot be mapped to the mechanisms described in this specification this compiler will not be supported by AUTOSAR. In this case, the compiler vendor has to adapt its compiler.

The concepts described in this document do only apply to C compilers according the standard C90. C++ is not in scope of this version.

In contradiction to the C-standard, some extensions are required:

- keywords for interrupt declaration
- keywords for hardware specific memory modifier
- uninitialized variables

If the physically existing memory is larger than the logically addressable memory in either code space or data space and more than the logically addressable space is used, logical addresses have to be reused. The C language (and other languages as well) can not cope with this situation.

# 4.2 Applicability to car domains

No restrictions.

# 4.3 Applicability to safety related environments

No restrictions. The compiler abstraction file does not implement any functionality, only symbols and macros.

# 5 Dependencies to other modules

**[COMPILER048]** The SWS Compiler Abstraction is applicable for each AUTOSAR basic software module and application software components. Therefore, the implementation of the memory class (memclass) and pointer class (ptrclass) macro parameters (see <a href="COMPILER040">COMPILER040</a>) shall fulfill the implementation and configuration specific needs of each software module in a specific build scenario. <a href="JCMCOMPILER040">JCMCOMPILER040</a>) (BSW00328, BSW00384)

#### 5.1 Code file structure

Not applicable

#### 5.2 Header file structure

[COMPILER052] Include structure of the compiler specific language extension header: (BSW00348, BSW00381, BSW00412)

Figure 1: Include structure of Compiler.h

## 5.3 Connections to other modules

The following shall describe the connections to modules, which are indirectly linked to each other.

#### 5.3.1 Compiler Abstraction

As described in this document, the compiler abstraction is used to configure the reachability of elements (pointers, variables, function etc.)

## 5.3.2 Memory Mapping

This module is used to do the sectioning of memory. The user can define sections for optimizing the source code.

## 5.3.3 Linker-Settings

The classification which elements are assigned to which memory section can be done by linker-settings.

# 7 Analysis

This chapter does not contain requirements. It just gives an overview of used keywords and their syntax within different compilers. This analysis is required for a correct and complete specification of methods and keywords and as rationale for those people who doubt the necessity of a compiler abstraction in AUTOSAR. This chapter is no complete overview of existing compilers and platforms and their usage in AUTOSAR. However, it shows examples that cover most use cases, from which the concepts specified in the consecutive chapters are derived.

# 7.1 Keywords for functions

On platforms with memory exceeding the addressable range of the architecture (e.g. S12X with 512k of Flash) the compiler needs to know if a called function is reachable within normal addressing commands ('near') or extended/paged addressing commands ('far').

Compiler analysis for near functions:

Compiler	Required syntax
Cosmic, S12X	@near void MyNearFunction(void);
	Call of a near function results in a local page call or to a call into
	direct page.
	Dependent of compiler settings the compiler controls only the
	calling convention or allocation and calling convention.
Metrowerks, S12X	<pre>voidnear MyNearFunction(void);</pre>
	Call of a near function results in a local page call or to a call into
	direct page.
IAR, HCS12 C/C++	<pre>voidnon_banked MyNearFunction (void);</pre>
Tasking, ST10	<pre>void _near MyNearFunction (void);</pre>
_	<pre>_near void MyNearFunction (void);</pre>
	Call of a near function results in a local segment code access
	(relevant in large model).
Tasking, TC1796	<pre>void MyNearFunction (void);</pre>
_	(No keywords required)
Greenhills, V850	<pre>void MyNearFunction (void);</pre>
	(No keywords required)
ADS, ST30	<pre>void MyNearFunction (void);</pre>
	(No keywords required)
DIABDATA, MPC5554	<pre>void MyNearFunction (void);</pre>
	(No keywords required)

Compiler analysis for far functions:

Compiler	Required syntax
Cosmic, S12X	<pre>@far void MyFarFunction(void);</pre>
	Dependent of compiler settings the compiler controls only the calling convention or allocation and calling convention.
Metrowerks, S12X	<pre>voidfar MyFarFunction(void);</pre>
IAR, HCS12 C/C++	<pre>voidbanked MyFarFunction (void);</pre>
Tasking, ST10	<pre>void _huge MyFarFunction (void);</pre>
	_huge void MyFarFunction (void);
Tasking, TC1796	<pre>void MyFarFunction (void);</pre>
	(No keywords required)
Greenhills, V850	<pre>void MyFarFunction (void);</pre>
	(No keywords required)
ADS, ST30	<pre>void MyFarFunction (void);</pre>
	(No keywords required)
DIABDATA, MPC5554	<pre>void MyFarFunction (void);</pre>
	(No keywords required)

# 7.2 Keywords for pointers

On platforms with memory exceeding the addressable range of the architecture (e.g. S12X with 512k of Flash) the compiler needs to know if data referenced by a pointer is accessible by normal addressing commands ('near') or extended/paged addressing commands ('far').

Compiler analysis for near pointers pointing to variable\_data in RAM (use case: pointer to data buffer where data has to be copied to):

Compiler	Required syntax	
Cosmic, S12X	@near uint8* MyNearPointer;	
Metrowerks, S12X	uint8*near MyNearPointer;	
IAR, HCS12 C/C++	uint8*data16 MyNearPointer;	
Tasking, ST10	_near uint8* MyNearPointer;	
Tasking, TC1796	uint8* MyNearPointer;	
	(No keywords required)	
Greenhills, V850	uint8* MyNearPointer	
	(No keywords required)	
ADS, ST30	uint8* MyNearPointer	
	(No keywords required)	
DIABDATA, MPC5554	uint8* MyNearPointer	
	(No keywords required)	

## Compiler analysis for far pointers pointing to variable data in RAM:

Compiler	Required syntax
Cosmic, S12X	@far uint8* MyFarPointer;
Metrowerks, S12X	uint8*far MyFarPointer;
IAR, HCS12 C/C++	(Information not available yet)
Tasking, ST10	_far uint8* MyFarPointer; /*14 bit arithmetic*/
	_huge uint8* MyFarPointer; /*24 bit arithmetic*/
	_shuge uint8* MyFarPointer; /*16 bit arithmetic*/
	/* My personal note: CRAZY */
Tasking, TC1796	uint8* MyFarPointer;
_	(No keywords required)
Greenhills, V850	uint8* MyFarPointer
	(No keywords required)
ADS, ST30	uint8* MyFarPointer
	(No keywords required)
DIABDATA, MPC5554	uint8* MyFarPointer
	(No keywords required)

Compiler analysis for near pointers pointing to constant data in RAM (use case pointer to data buffer where data has to be read from):

Compiler	Required syntax
Cosmic, S12X	@near uint8* MyNearPointer;
	(Results in access of direct memory area)
Metrowerks, S12X	const uint8*near MyNearPointer;
	(Results in access of direct memory area)
IAR, HCS12 C/C++	const uint8* MyNearPointer;
	(Results in access of direct memory area)
Tasking, ST10	const _near uint8* MyNearPointer;
Tasking, TC1796	const _near uint8* MyNearPointer;
Greenhills, V850	const uint8* MyNearPointer
	(No additional keywords required)
ADS, ST30	const uint8* MyNearPointer
	(No additional keywords required)
DIABDATA, MPC5554	const uint8* MyNearPointer
	(No additional keywords required)

## Compiler analysis for far pointers pointing to constant data in RAM:

Compiler	Required syntax
Cosmic, S12X	@far uint8* MyFarPointer;
Metrowerks, S12X	const uint8*far MyFarPointer;
IAR, HCS12 C/C++	(Information not available yet)
Tasking, ST10	const _far uint8* MyFarPointer;
Tasking, TC1796	uint8* MyFarPointer;
_	(No keywords required)
Greenhills, V850	const uint8* MyFarPointer
	(No additional keywords required)
ADS, ST30	const uint8* MyFarPointer
	(No additional keywords required)
DIABDATA, MPC5554	const uint8* MyFarPointer
	(No additional keywords required)

Compiler analysis for near pointers pointing to data in ROM (use case pointer to display data in ROM passed to SPI Driver):

Compiler	Required syntax
Cosmic, S12X	const uint8* MyNearPointer;
	(Without near keyword because this is by default near!)
Metrowerks, S12X	const uint8*near MyNearPointer;
IAR, HCS12 C/C++	const uint8* MyNearPointer;
	(Without near keyword because this is by default near!)
Tasking, ST10	const _near uint8* MyNearPointer;
Tasking, TC1796	const uint8* MyNearPointer;
_	(No keywords required)
Greenhills, V850	const uint8* MyNearPointer
	(No additional keywords required)
ADS, ST30	const uint8* MyNearPointer
	(No additional keywords required)
DIABDATA, MPC5554	const uint8* MyNearPointer
	(No additional keywords required)

Compiler analysis for far pointers pointing to constant data in ROM:

Compiler	Required syntax
Cosmic, S12X	not possible
Metrowerks, S12X	const uint8*far MyFarPointer;
IAR, HCS12 C/C++	Access function and the banked constant data are located in the same bank:
	const uint8* MyFarPointer;
	but caller shall use theaddress_24_of macro
	Access function is located in non-banked memory: PPAGE register has to be handled manually
	Access function and the banked constant data are located in different banks:
	Not possible
Tasking, ST10	const _far uint8* MyFarPointer;
Tasking, TC1796	const uint8* MyFarPointer;
	(No keywords required)
Greenhills, V850	const uint8* MyFarPointer
	(No additional keywords required)
ADS, ST30	const uint8* MyFarPointer
	(No additional keywords required)
DIABDATA, MPC5554	const uint8* MyFarPointer
	(No additional keywords required)

The HW architecture of the S12X supports different paging mechanisms with different limitations e.g. supported instruction set or pointer distance. Therefore the IAR, HCS12 C/C++ and the Cosmic, S12X compilers are limited in the usage of generic pointers applicable for the whole memory area because of the expected code overhead.

Conclusion: These vendors should adapt their compilers, because a generic SW architecture as described by AUTOSAR cannot be adjusted in every case to the platform specific optimal solution.

Compiler analysis for pointers, where the symbol of the pointer itself is placed in near-memory:

Compiler	Required syntax
Cosmic, S12X	uint8* @near MyPointerInNear;
Metrowerks, S12X	near uint8* MyPointerInNear;
Tasking, ST10	uint8* _near MyPointerInNear;
Tasking, TC1796	uint8* MyPointerInNear;
	(No keywords required)
Greenhills, V850	uint8* MyPointerInNear
	(No keywords required)
ADS, ST30	uint8* MyPointerInNear
	(No keywords required)
DIABDATA, MPC5554	uint8* MyPointerInNear
	(No keywords required)

Compiler analysis for pointers, where the symbol of the pointer itself is placed in farmemory:

Compiler	Required syntax
Cosmic, S12X	uint8* @far MyPointerInFar;
Metrowerks, S12X	far uint8* MyPointerInFar;
Tasking, ST10	uint8* _far MyPointerInFar;
Tasking, TC1796	uint8* MyPointerInFar;
	(No keywords required)
Greenhills, V850	uint8* MyPointerInFar
	(No keywords required)
ADS, ST30	uint8* MyPointerInFar
	(No keywords required)
DIABDATA, MPC5554	uint8* MyPointerInFar
	(No keywords required)

The examples above lead to the conclusion, that for definition of a pointer it is not sufficient to specify only one memory class. Instead, a combination of two memory classes, one for the pointer's 'distance' and one for the pointer's symbol itself, is possible, e.g.:

```
/* Tasking ST10, far-pointer in near memory
* (both content and pointer in RAM)
*/
_far uint8* _near MyFarPointerInNear;
```

Compiler analysis for function pointers:

Compiler	Required syntax
Cosmic, S12X	@near void (* const Irq_InterruptVectorTable[])(void) Call of a near function results in an interpage call or to a call into direct page:

Compiler	Required syntax
Metrowerks, S12X	<pre>void (*constnear Irq_InterruptVectorTable[]) (void)</pre>
·	Call of a near function results in an interpage call or to a call into direct
	page:
	Near functions and far functions are not compatible because of other ret-
	statements:
IAR, HCS12 C/C++	non_banked void (* const
	<pre>Irq_InterruptVectorTable[])(void)</pre>
	Casting fromnon_banked tobanked is performed through zero
	extension:
	Casting frombanked tonon_banked is an illegal operation.
Tasking, ST10	_far void (*NvM_AsyncCbkPtrType)
3, 1	(NvM_ModuleIdType ModuleId,
	NvM_ServiceIdType ServiceId )
	Call of a near function results in a local segment code access (relevant in
	large model):
Tasking, TC1796	<pre>void (*NvM_AsyncCbkPtrType)</pre>
	(NvM_ModuleIdType ModuleId,
	NvM_ServiceIdType ServiceId )
	(No additional keywords required)
Greenhills, V850	<pre>void (*NvM_AsyncCbkPtrType)</pre>
	(NvM_ModuleIdType ModuleId,
	NvM_ServiceIdType ServiceId )
	(No additional keywords required)
ADS, ST30	<pre>void (*NvM_AsyncCbkPtrType)</pre>
	(NvM_ModuleIdType ModuleId,
	NvM_ServiceIdType ServiceId )
	(No additional keywords required)
DIABDATA, MPC5554	<pre>void (*NvM_AsyncCbkPtrType)</pre>
	(NvM_ModuleIdType ModuleId,
	NvM_ServiceIdType ServiceId )
	(No additional keywords required)

# 8 Functional specification

#### 8.1 General issues

[COMPILER003] For each compiler and platform an own compiler abstraction

has to be provided. | (BSW00348, BSW00361)

## 8.2 Contents of Compiler.h

[COMPILER004] \( \text{ The file name of the compiler abstraction shall be 'Compiler.h'.} \) (BSW00348, BSW00361)

**[COMPILER053]** The file Compiler.h shall contain the definitions and macros specified in chapter 9. Those are fix for one specific compiler and platform. ()

**[COMPILER005]** \( \text{If a compiler does not require or support the usage of special keywords; the corresponding macros specified by this specification shall be provided as empty definitions or definitions without effect.

Example:

```
#define FUNC(type, memclass) type
/* not required for DIABDATA */ | ()
```

[COMPILER010] \( \text{ The compiler abstraction shall define a symbol for the target compiler according to the following naming convention: \( \text{\convertion:} \) \( \tex

Note: These defines can be used to switch between different implementations for different compilers, e.g.

- inline assembler fragments in drivers
- special pragmas for memory alignment control
- localization of function calls
- adaptions to memory models | (BWS00306, BSW006)

List of symbols: see <a href="COMPILER012">COMPILER012</a>

**[COMPILER030]** 「"Compiler.h" shall provide information of the supported compiler vendor and the applicable compiler version. 」()

**[COMPILER035]** The macro parameters memclass and ptrclass shall not be filled with the compiler specific keywords but with one of the configured values in COMPILER040. | (BWS00306, BSW006)

The rationale is that the module's implementation shall not be affected when changing a variable's, a pointer's or a function's storage class.

[COMPILER036] C forbids the use of the far/near-keywords on function local variables (auto-variables). For this reason when using the macros below to allocate a pointer on stack, the memclass-parameter shall be set to AUTOMATIC. J (BWS00306, BSW006)

**[COMPILER047]** The Compiler.h header file shall protect itself against multiple inclusions.

For instance:

```
#ifndef COMPILER_H
    #define COMPILER_H
    /* implementation of Compiler.h */
    ...
#endif /* COMPILER H */
```

There may be only comments outside of the ifndef - endif bracket. | ()

**[COMPILER050]** It is allowed to extend the Compiler Abstraction header with vendor specific extensions. Vendor specific extended elements shall contain the AUTOSAR Vendor ID in the name. | ()

# 8.3 Contents of Compiler\_Cfg.h

[COMPILER055] \( \text{ The file Compiler\_Cfg.h shall contain the module/component specific parameters (ptrclass and memclass) that are passed to the macros defined in Compiler.h. See <a href="COMPILER040">COMPILER040</a> for memory types and required syntax. \( \text{()} \)

**[COMPILER054]** Module specific extended elements shall contain the module abbreviation of the BSW module in the name. Application software component specific extended elements shall contain the Software Component Type's name. ()

# 9 API specification

# 9.1 Definitions

# 9.1.1 Memory class AUTOMATIC

Define:	AUTOMATIC
Range:	"empty"
Description:	COMPILER046: The memory class AUTOMATIC shall be provided as empty
•	definition, used for the declaration of local pointers.
Caveats:	COMPILER040

# 9.1.2 Memory class TYPEDEF

Define:	TYPEDEF
Range:	"empty"
Description:	<b>COMPILER059:</b> The memory class TYPEDEF shall be provided as empty definition. This memory class shall be used within type definitions, where no memory qualifier can be specified. This can be necessary for defining pointer types, with e.g. P2VAR, where the macros require two parameters. First parameter can be specified in the type definition (distance to the memory location referenced by the pointer), but the second one (memory allocation of the pointer itself) cannot be defined at this time. Hence, memory class TYPEDEF shall be applied.
Caveats:	COMPILER040

# 9.1.3 NULL\_PTR

Define:	NULL_PTR
Range:	void pointer ((void *)0)
Description:	<b>COMPILER051</b> : The compiler abstraction shall provide the NULL_PTR define with a void pointer to zero definition.

## 9.1.4 INLINE

Define:	INLINE
Range:	inline/"empty"
Description:	<b>COMPILER057</b> : The compiler abstraction shall provide the INLINE define for abstraction of the keyword inline.

Caveats:	
Caveais.	<del>_</del>

#### 9.1.5 LOCAL\_INLINE

Define:	LOCAL_INLINE
Range:	static inline/"empty"
Description:	<b>COMPILER060</b> : The compiler abstraction shall provide the LOCAL_INLINE define for abstraction of the keyword inline in functions with "static" scope.
Caveats:	Different compilers may require a different sequence of the keywords "static" and "inline" if this is supported at all.

#### 9.2 Macros for functions

#### 9.2.1 FUNC

Macro name:	FUNC	
Syntax:	#define FUNC(rettype, memclass)	
Parameters	rettype return type of the function	
(in):	memclass classification of the function itself	
Parameters (out):	none	
Return value:	none	
Description:	COMPILER001: The compiler abstraction shall define the FUNC macro for the declaration and definition of functions that ensures correct syntax of function declarations as required by a specific compiler.  COMPILER058: In the parameter list of this macro no further Compiler Abstraction macros shall be nested. Instead, use a previously defined type as return type or use FUNC_P2CONST/FUNC_P2VAR. Example:  typedef P2VAR(uint8, AUTOMATIC, <prefix>_VAR) NearDataType; FUNC(NearDataType, <prefix>_CODE) FarFuncReturnsNearPtr(void);</prefix></prefix>	
Caveats:		
Configuration:		

## Example (Cosmic, S12X):

#define <PREFIX>\_CODE @near
#define FUNC(rettype, memclass) memclass rettype

#### Required usage for function declaration and definition:

FUNC(void, <PREFIX>\_CODE) ExampleFunction (void);

## 9.2.2 FUNC\_P2CONST

Macro name:	FUNC_P2CONST	
Syntax:	<pre>#define FUNC_P2CONST(rettype, ptrclass, memclass)</pre>	
Parameters	rettype return type of the function	
(in):	ptrclass defines the classification of the pointer's distance	
	memclass classification of the function itself	
Parameters (out):	none	
Return value:	none	
Description:	COMPILER061: The compiler abstraction shall define the FUNC_P2CONST macro for the declaration and definition of functions returning a pointer to a constant. This shall ensure the correct syntax of function declarations as required by a specific compiler.  COMPILER062: In the parameter list of the FUNC_P2CONST, no further Compiler Abstraction macros shall be nested.	
Caveats:		
Configuration:		

## Example (Cosmic, S12X):

```
#define <PREFIX>_PBCFG     @far
#define <PREFIX>_CODE      @near
#define FUNC_P2CONST(rettype, ptrclass, memclass)\
const ptrclass rettype * memclass
```

## Required usage for function declaration and definition:

```
FUNC_P2CONST(uint16, <PREFIX>_PBCFG, <PREFIX>_CODE)
ExampleFunction (void);
```

#### 9.2.3 FUNC\_P2VAR

Macro name:	FUNC_P2VAR	FUNC_P2VAR	
Syntax:	<pre>#define FUNC_P2VAR(rettype, ptrclass, memclass)</pre>		
Parameters	rettype	return type of the function	
(in):	ptrclass	defines the classification of the pointer's distance	
	memclass	classification of the function itself	
Parameters (out):	none		
Return value:	none		
Description:	for the declaration and shall ensure the correct compiler.	ompiler abstraction shall define the FUNC_P2VAR macro definition of functions returning a pointer to a variable. This t syntax of function declarations as required by a specific parameter list of the macro FUNC_P2VAR, no further nacros shall be nested.	
Caveats:			
Configuration:			

#### Example (Cosmic, S12X):

#### Required usage for function declaration and definition:

```
FUNC_P2VAR(uint16, <PREFIX>_PBCFG, <PREFIX>_CODE)
ExampleFunction (void);
```

# 9.3 Macros for pointers

#### 9.3.1 P2VAR

Macro name:	P2VAR	
Syntax:	#define P2VAR(ptrtype, memclass, ptrclass)	
Parameters	ptrtype	type of the referenced variable
(in):	memclass	classification of the pointer's variable itself
	ptrclass	defines the classification of the pointer's distance
Parameters (out):	none	
Return value:	none	
Description:	COMPILER006: The compiler abstraction shall define the P2VAR macro for the declaration and definition of pointers in RAM, pointing to variables.  The pointer itself is modifiable (e.g. ExamplePtr++).  The pointer's target is modifiable (e.g. *ExamplePtr = 5).	
Caveats:		

Configuration:	

#### Example (Metrowerks, S12X):

## Required usage for pointer declaration and definition:

```
#define SPI_APPL_DATA @far
#define SPI_VAR_FAST @near
```

P2VAR(uint8, SPI\_VAR\_FAST, SPI\_APPL\_DATA) Spi\_FastPointerToApplData;

#### 9.3.2 P2CONST

Macro name:	P2CONST P2CONST						
Syntax:	<pre>#define P2CONST(ptrtype, memclass, ptrclass)</pre>						
Parameters (in):	ptrtype type of the referenced constant						
	memclass classification of the pointer's variable itself						
	ptrclass defines the classification of the pointer's distance						
Parameters (out):	none						
Return value:	none						
Description:	COMPILER013: The compiler abstraction shall define the P2CONST macro for the declaration and definition of pointers in RAM pointing to constants  The pointer itself is modifiable (e.g. ExamplePtr++).  The pointer's target is not modifiable (read only).						
Caveats:							
Configuration:							

#### Example (Metrowerks, S12X):

#### Example (Cosmic, S12X):

#### Example (Tasking, ST10):

#### Required usage for pointer declaration and definition:

```
#define EEP_APPL_CONST @far
#define EEP_VAR @near
```

P2CONST(Eep\_ConfigType, EEP\_VAR, EEP\_APPL\_CONST) Eep\_ConfigurationPtr;

#### 9.3.3 CONSTP2VAR

Macro name:	CONSTP2VAR						
Syntax:	<pre>#define CONSTP2VAR (ptrtype, memclass, ptrclass)</pre>						
Parameters	ptrtype	ptrtype type of the referenced variable					
(in):	memclass	classification of the pointer's constant itself					
	ptrclass	defines the classification of the pointer's distance					
Parameters (out):	none						
Return value:	none						
Description:	for the declaration and  The pointer itself is not	COMPILER031: The compiler abstraction shall define the CONSTP2VAR macro or the declaration and definition of constant pointers accessing variables.  The pointer itself is not modifiable (fix address).  The pointer's target is modifiable (e.g. *ExamplePtr = 18).					
Caveats:		·					
Configuration:							

#### Example (Tasking, ST10):

### Required usage for pointer declaration and definition:

```
/* constant pointer to application data */
CONSTP2VAR (uint8, NVM_VAR, NVM_APPL_DATA)
NvM_PointerToRamMirror = Appl_RamMirror;
```

#### 9.3.4 CONSTP2CONST

Macro name:	CONSTP2CONST						
Syntax:	<pre>#define CONSTP2CONST(ptrtype, memclass, ptrclass)</pre>						
Parameters	ptrtype type of the referenced constant						
(in):	memclass classification of the pointer's constant itself						
	ptrclass defines the classification of the pointer's distance						
Parameters (out):	none						
Return value:	none						
Description:	COMPILER032: The compiler abstraction shall define the CONSTP2CONST macro for the declaration and definition of constant pointers accessing constants.  The pointer itself is not modifiable (fix address).  The pointer's target is not modifiable (read only).						
Caveats:							
Configuration:							

## Example (Tasking, ST10):

#### Required usage for pointer declaration and definition:

```
#define CAN_PBCFG_CONST @gpage
#define CAN_CONST @near

/* constant pointer to the constant postbuild configuration
data */
CONSTP2CONST (Can_PBCfgType, CAN_CONST, CAN_PBCFG_CONST)
Can_PostbuildCfgData = CanPBCfgDataSet;
```

#### 9.3.5 P2FUNC

Macro name:	P2FUNC					
Syntax:	#define P2FUNC(re	ttype, ptrclass, fctname)				
Parameters	rettype return type of the function					
(in):	ptrclass	defines the classification of the pointer's distance				
	fctname	function name respectively name of the defined type				
Parameters	none					
(out):						
Return value:	none					
Description:	<b>COMPILER039</b> : The compiler abstraction shall define the P2FUNC macro for the type definition of pointers to functions.					
Caveats:						
Configuration:						

## Example (Metrowerks, S12X):

#### Example (Cosmic, S12X):

#### Required usage for pointer type declaration:

```
#define EEP_APPL_CONST @far
#define EEP_VAR @near

typedef P2FUNC (void, NVM_APPL_CODE, NvM_CbkFncPtrType) (void);
```

# 9.4 Keywords for constants

#### 9.4.1 CONST

Macro name:	CONST					
Syntax:	<pre>#define CONST(consttype, memclass)</pre>					
Parameters	consttype t	ype of the constant				
(in):	memclass (	classification of the constant itself				
Parameters	none -	-				
(out):						
Return value:	none -	-				
Description:	COMPILER023: The cordeclaration and definition	mpiler abstraction shall define the CONST macro for the of constants.				
Caveats:						
Configuration:						

Example (Cosmic, S12X):

#define CONST(type, memclass) memclass const type

Required usage for declaration and definition:

#define NVM\_CONST @gpage

CONST(uint8, NVM\_CONST) NvM\_ConfigurationData;

# 9.5 Keywords for variables

#### 9.5.1 VAR

Macro name:	VAR						
Syntax:	<pre>#define VAR(vartype, memclass)</pre>						
Parameters	vartype	type of the variable					
(in):	memclass	classification of the variable itself					
Parameters	none						
(out):							
Return value:	none						
Description:	COMPILER026: The co declaration and definition	mpiler abstraction shall define the VAR macro for the not variables.					
Caveats:							
Configuration:							

Example (Tasking, ST10):

#define VAR(type, memclass) memclass type

Required usage for declaration and definition:

#define NVM\_FAST\_VAR \_near

VAR(uint8, NVM\_FAST\_VAR) NvM\_VeryFrequentlyUsedState;

# 10 Sequence diagrams

Not applicable.

# 11 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification, Chapter 11.1 describes fundamentals. We intend to leave Chapter 11.1 in the specification to guarantee comprehension.

Chapter 11.2 specifies the structure (containers) and the parameters of this module.

Chapter 11.3 specifies published information of this module.

## 11.1 How to read this chapter

In addition to this section, it is highly recommended to read the documents:

- AUTOSAR Layered Software Architecture [3]
- AUTOSAR ECU Configuration Specification [4]. This document describes the AUTOSAR configuration methodology and the AUTOSAR configuration metamodel in detail.

The following is only a short survey of the topic and it will not replace the ECU Configuration Specification document.

#### 11.1.1 Configuration and configuration parameters

Configuration parameters define the variability of the generic part(s) of an implementation of a module. This means that only generic or configurable module implementation can be adapted to the environment (software/hardware) in use during system and/or ECU configuration.

The configuration of parameters can be achieved at different times during the software process: before compile time, before link time or after build time. In the following, the term "configuration class" (of a parameter) shall be used in order to refer to a specific configuration point in time.

#### 11.1.2 Variants

Variants describe sets of configuration parameters. E.g., variant 1: only pre-compile time configuration parameters; variant 2: mix of pre-compile- and post build time-configuration parameters. In one variant, a parameter can only be of one configuration class.

Thus, describe the possible configuration variants of this module. Each Variant must have a unique name, which could be referenced to in later chapters. The maximum number of allowed variants is 3.

#### 11.1.3 Containers

Containers structure the set of configuration parameters. This means:

- all configuration parameters are kept in containers
- (sub-) containers can reference (sub-) containers. It is possible to assign a
  multiplicity to these references. The multiplicity then defines the possible number
  of instances of the contained parameters

## 11.2 Containers and configuration parameters

The following chapters summarize all configuration parameters. The detailed meanings of the parameters describe Chapters 8 and Chapter 9.

#### 11.2.1 Variants

Variant PC (**P**re **C**ompile): This is the only variant because all configuration parameters are pre-compile time parameters, which influence the compilation process.

Each of the different memory classes (memclass) and pointer classes (ptrclass) is represented by a define.

SWS Item	COMPILER044					
Container Name	<prefix>_MemoryAndPointerClasses</prefix>					
Description	This container contains the memory and pointer class parameters of a single module or of an application software component.  For each module, this container has to be provided.  The number of different pointer and memory classes per module depends on the different types of variables, constants and pointers used by the module. It is allowed to extend the classes by module specific classes.  The scope of all parameters is ECU because many parameters depend on the parameters of other modules. Examples for this are given in the Annex (starting on page 42).  For an explanation of <prefix> see <a href="COMPILER040">COMPILER040</a>.</prefix>					
Configuration Parameters						

# 11.2.2 Module/Component Configuration (Memory and pointer classes)

Name	<prefix>_CODE</prefix>			
Description	Configurable memory class for code.			
Туре	#define			
Unit	Compiler specific, refer to chapter 7			
Range	Compiler specific, refer to chapter 7 e.g. @near, _far			
Configuration Class	Pre-compile	Х	Vai	riant PC
	Link time			
	Post Build			
Scope	ECU			
Dependency	Memory Mapping			

Name	<prefix>_VAR_NOINIT</prefix>			
Description	Configurable memory class for all global or static variables that are never initialized.			
Туре	#define			
Unit	Compiler specific, refer to chapter 7			
Range	Compiler specific, refer to chapter 7 e.g. @near, _far			
Configuration Class	Pre-compile	Х	Vai	riant PC
	Link time			
	Post Build			
Scope	ECU			
Dependency	Memory Mapping			

Name	<prefix>_VAR_POWER_ON_INIT</prefix>			
Description	Configurable memory class for all global or static variables that are initialized only after power on reset.			
Туре	#define			
Unit	Compiler specific, refer to chapter 7			
Range	Compiler specific, refer to chapter 7 e.g. @near, _far			
Configuration Class	Pre-compile x Variant PC			
	Link time			
	Post Build			
Scope	ECU			
Dependency	Memory Mapping			

Name	<prefix>_VAR_FAST</prefix>				
Name		<pre><pre><pre><pre><pre><pre><pre><pre></pre></pre></pre></pre></pre></pre></pre></pre>			
Description	Configurable memory class for all global or static variables that have at least one of the following properties:				
	<ul> <li>accessed bitwise</li> </ul>				
	<ul> <li>frequently used</li> </ul>				
	<ul> <li>high number of acc</li> </ul>	esses	in s	ource code	
Туре	#define				
Unit	Compiler specific, refer to chapter 7				
Range	Compiler specific, refer to c	hapteı	7	e.g. @near	
Configuration Class	Pre-compile	Х	Va	riant PC	
	Link time				
	Post Build				
Scope	ECU				
Dependency	Memory Mapping				

Name	<prefix>_VAR</prefix>			
Description	Configurable memory class for all global or static variables that are initialized after every reset.			
Туре	#define			
Unit	Compiler specific, refer to chapter 7			
Range	Compiler specific, refer to chapter 7 e.g. @near			
Configuration Class	Pre-compile	Х	Vai	riant PC
	Link time	-		
	Post Build			
Scope	ECU			
Dependency	Memory Mapping			

Name	<prefix>_CONST</prefix>			
Description	Configurable memory class for global or static constants.			
Туре	#define			
Unit	Compiler specific, refer to chapter 7			
Range	Compiler specific, refer to chapter 7			
Configuration Class	Pre-compile x Variant PC			riant PC
	Link time			
	Post Build			
Scope	ECU			
Dependency	Memory Mapping			

Name	<prefix>_APPL_DATA</prefix>				
Description	Configurable memory class for pointers to application data (expected to be in RAM or ROM) passed via API.				
Туре	#define				
Unit	Compiler specific, refer to chapter 7				
Range	Compiler specific, refer to chapter 7				
Configuration Class	Pre-compile	Χ	Variant PC		
	Link time				
	Post Build				
Scope	ECU				
Dependency	Memory Mapping				

Name	<prefix>_APPL_CONST</prefix>				
Description	Configurable memory class for pointers to application constants (expected to be certainly in ROM, for instance pointer of Init-function) passed via API.				
Туре	#define				
Unit	Compiler specific, refer to chapter 7				
Range	Compiler specific, refer to chapter 7				
Configuration Class	Pre-compile	Х	x Variant PC		
	Link time				
	Post Build				
Scope	ECU				
Dependency	Memory Mapping				

Name	<prefix>_APPL_CODE</prefix>			
Description	Configurable memory class for pointers to application functions (e.g. call back function pointers).			
Туре	#define			
Unit	Compiler specific, refer to chapter 7			
Range	Compiler specific, refer to chapter 7			
Configuration Class	Pre-compile x Variant PC			
	Link time			
	Post Build			
Scope	ECU			
Dependency	Memory Mapping			

Name	<prefix>_CALLOUT_CODE</prefix>			
Description	Configurable memory class for pointers to application functions (e.g. callout function pointers).			
Туре	#define			
Unit	Compiler specific, refer to chapter 7			
Range	Compiler specific, refer to chapter 7			
Configuration Class	<b>Pre-compile</b> x Variant PC			
	Link time			
	Post Build			
Scope	ECU			
Dependency	Memory Mapping			

Included Containers		
Container Name	Multiplicity	Scope / Dependency
None		

Name	REGSPACE				
Description	Configurable memory class for pointers to registers (e.g. static				
•	volatile CONSTP2VAR(	uint1	6,	PWM_CONST, REGSPACE)).	
Туре	#define				
Unit	Compiler specific, refer to chapter 7				
Range	Compiler specific, refer to chapter 7 e.g. @near, _far				
Configuration Class	Pre-compile x Variant PC				
	Link time				
	Post Build				
Scope	ECU				
Dependency	Memory Mapping				

**[COMPILER042]** \( \text{ The file Compiler.h is specific for each build scenario. Therefore there is no standardized configuration interface specified. \( \) ()

### 11.3 Published Information

[[COMPILER001\_PI]] 「 The standardized common published parameters as required by BSW00402 in the General Requirements on Basic Software Modules [2] shall be published within the header file of this module and need to be provided in the BSW Module Description. The according module abbreviation can be found in the List of Basic Software Modules [1].」(BWS003, BWS00318, BSW00321, BSW00374, BSW00379, BSW00402)

Additional module-specific published parameters are listed below if applicable.

## 12 Annex

## 12.1 List of Compiler symbols

**[COMPILER012]** \( \text{The following table defines target compiler symbols according to \( \text{COMPILER010} \). For each compiler supported by AUTOSAR a symbol has to be defined. \( \text{[BWS00306, BSW006)} \)

Platform	Compiler	Compiler symbol
S12X	Code Warrior	_CODEWARRIOR_C_S12X_
S12X	Cosmic	_COSMIC_C_S12X_
TC1796/	Tasking	_TASKING_C_TRICORE_
TC1766		
ST10	Tasking	_TASKING_C_ST10_
ST30	ARM Developer Suite	_ADS_C_ST30_
V850	Greenhills	_GREENHILLS_C_V850_
MPC5554	Diab Data	_DIABDATA_C_ESYS_
TMS470	Texas Instruments	_TEXAS_INSTRUMENTS_C_TMS470_
ARM	Texas Instruments	_TEXAS_INSTRUMENTS_C_ARM_

# 12.2 Requirements on implementations using compiler abstraction

**[COMPILER040]** Feach AUTOSAR software module and application software component shall support the distinction of at least the following different memory classes and pointer classes.

It is allowed to add module specific memory classes and pointer classes as they are mapped and thus are configurable within the Compiler\_Cfg.h file.

#### <PREFIX> is

- composed according <snp>[ <vi> <ai>] for basic software modules where
  - o <snp> is the Section Name Prefix which shall be the BswModuleDescription's shortName converted in upper case letters
  - o <vi> is the vendorId of the BSW module
  - o <ai> is the vendorApiInfix of the BSW module

The sub part in squared brackets [\_<vi>\_<ai>] is omitted if no vendorApiInfix is defined for the Basic Software Module which indicates that it does not use multiple instantiation.

• the shortName of the software component type for software components (case sensitive)

Memory type	Syntax of memory class (memclass) and pointer class (ptrclass) macro parameter	Comments	Located in
Code	<prefix>_CODE</prefix>	To be used for code.	
Constants	<prefix>_CONST</prefix>	To be used for global or static constants	
Pointer	<prefix>_APPL_DATA</prefix>	To be used for references on application data (expected to be in RAM or ROM) passed via API	
Pointer	<prefix>_APPL_CONST</prefix>	To be used for references on application constants (expected to be certainly in ROM, for instance pointer of Initfunction) passed via API	
Pointer	<prefix>_APPL_CODE</prefix>	To be used for references on application functions. (e.g. call back function pointers)	
Variables	<prefix>_CALLOUT_CODE</prefix>	To be used for references on application functions. (e.g. callout function pointers)	Compiler_Cfg.h
Variables	<prefix>_VAR_NOINIT</prefix>	To be used for all global or static variables that are never initialized	
Variables	<pre><pre><pre><pre><pre><pre><pre>ON_I</pre></pre></pre></pre></pre></pre></pre>	To be used for all global or static variables that are initialized only after power on reset	
Variables	<prefix>_VAR_FAST</prefix>	To be used for all global or static variables that have at least one of the following properties:  accessed bitwise frequently used high number of accesses in source code	
Variables	<prefix>_VAR</prefix>	To be used for global or static variables that are initialized after every reset.	
Variables	AUTOMATIC	To be used for local non static variables	Compiler.h
Type Definitions	TYPEDEF	To be used in type definitions, where no memory qualifier can be specified.	Compiler.h

」()

**[COMPILER041]** Feach AUTOSAR software module and application software component shall wrap declaration and definition of code, variables, constants and pointer types using the following keyword macros: ()

# 12.3 Proposed process

To allow development and integration within a multi supplier environment a certain delivery process is indispensable. The following description can be seen as proposal:

Figure 2: Proposal of integration-process

## 12.4 Comprehensive example

This example shows for a single API function where which macro is defined, used and configured.

Module: Eep

API function: Eep\_Read Platform: S12X Compiler: Cosmic

#### File Eep.c:

#### File Compiler.h:

```
#include "Compiler_Cfg.h"

#define AUTOMATIC
#define FUNC(rettype, memclass) rettype memclass
#define P2VAR(ptrtype, memclass, ptrclass) ptrclass ptrtype * memclass
```

#### File Compiler\_Cfg.h:

```
#define EEP_CODE
#define EEP_APPL_DATA @far  /* RAM blocks of NvM are in banked RAM */
```

#### What are the dependencies?

EEP\_APPL\_DATA is defined as 'far'. This means that the pointers to the RAM blocks managed by the NVRAM Manager have to be defined as 'far' also. The application can locate RAM mirrors in banked RAM but also in non-banked RAM. The mapping of the RAM blocks to banked RAM is done in a MemMap \*.h.

Because the pointers are also passed via Memory Interface and EEPROM Abstraction, their pointer and memory classes must also fit to EEP\_APPL\_DATA.

What would be different on a 32-bit platform?

Despite the fact that only the S12X has an internal EEPROM, the only thing that would change in terms of compiler abstraction are the definitions in Compiler\_Cfg.h. They would change to empty defines:

```
#define EEP_CODE
#define EEP APPL DATA
```
